

# **LAMB OF GOD COMMUNITY DUCK FARMING PROJECT- OFFICIAL PRESENTATION**

## **Project Title: Lamb of God Community Duck Farming Project**

### **Project Background**

Many rural communities face economic challenges, limited income opportunities, and food insecurity. Churches and community centers can play a vital role not only in spiritual growth but also in empowering their communities economically. This duck farming project is designed to provide rural communities with a sustainable source of income, improve nutrition, and develop practical skills, while also supporting local development and social initiatives.

### **Project Objective**

The primary objective of this project is to establish a community-managed duck farming initiative to:

- Generate sustainable income for local churches and community activities
- Improve food security by providing access to fresh duck eggs and meat
- Create training and employment opportunities for youth and families
- Promote self-reliance, entrepreneurship, and community development in rural areas

### **Project Description**

The project will involve constructing a small duck house with a pond or water area for ducks to swim, along with a fenced yard for roaming. Ducks will be raised for both egg production and meat. The project will start at a manageable scale and gradually expand as experience, resources, and community involvement grow.

Church leaders and selected community members will receive training in duck management, including housing, feeding, disease prevention, pond management,

and marketing. Emphasis will be placed on proper animal care, hygiene, and sustainable practices.

## **Target Beneficiaries**

- Church members and leadership in rural areas
- Youth and women seeking skills and income opportunities
- Vulnerable families in the community
- The wider local community through access to duck products

## **Expected Outcomes**

- A fully operational duck farming project managed by the community
- Increased income to support church programs and community initiatives
- Improved nutrition and access to protein-rich foods
- Skills development and practical training for community members
- Strengthened community engagement and self-sufficiency

## **Sustainability**

The project is designed to be self-sustaining. Income generated from selling ducks and duck products will be reinvested into feed, pond maintenance, and expansion. A simple management and accountability system will ensure transparency, proper use of resources, and long-term project success.

## **Conclusion**

The Lamb of God Community Duck Farming Project represents a practical approach to community development through local initiative and church leadership. By combining faith, responsibility, and economic empowerment, rural communities can generate income, improve nutrition, and foster sustainable development for generations to come.
