

LAMB OF GOD COMMUNITY POULTRY PROJECT

Project Background

Many rural churches operate in communities facing economic hardship, unemployment, and limited income-generating opportunities. While churches play a vital spiritual role, they can also serve as centers for social and economic empowerment. This poultry farming project is designed to help rural churches generate sustainable income, support vulnerable families, and strengthen community development.

Project Objective

The primary objective of this project is to establish a small-scale poultry farming initiative managed by the local church to:

- Generate sustainable income for church activities and community support
- Improve food security through access to eggs and poultry meat
- Create employment and training opportunities for church members and youth
- Promote self-reliance and economic empowerment in rural areas

Project Description

The project involves setting up a poultry farm within or near the church compound using locally available materials and appropriate farming techniques. The church will raise chickens (layers and/or broilers) for egg production and meat consumption. The project will begin on a small scale and gradually expand based on available resources and community participation.

Church leaders and selected members will receive basic training in poultry management, including feeding, housing, hygiene, disease prevention, and marketing. Emphasis will be placed on good animal care, cleanliness, and sustainability.

Target Beneficiaries

- Rural churches and church leadership
- Church members, especially youth and women
- Vulnerable families within the community
- The wider local community through affordable poultry products

Expected Outcomes

- A functional poultry farm managed by the church
- Increased income to support church programs and social assistance
- Improved nutrition through access to eggs and poultry meat
- Skills development and practical training for community members
- Strengthened community engagement and self-sufficiency

Sustainability

The poultry farming project is designed to be self-sustaining. Income generated from the sale of eggs and chickens will be reinvested into feed, maintenance, and expansion of the farm. The church will establish a simple management and accountability system to ensure transparency and long-term success.

Conclusion

This poultry farming project represents a practical and impactful approach to community development through the local church. By combining faith, responsibility, and economic initiative, rural churches can become agents of hope, empowerment, and sustainable change for their communities.
